Norm- and Criterion-Referenced Testing.

Linda A. Bond

North Central Regional Educational Laboratory

Tests can be categorized into two major groups: norm-referenced tests and criterion-referenced tests. These two tests differ in their intended purposes, the way in which content is selected, and the scoring process which defines how the test results must be interpreted. This brief paper will describe the differences between these two types of assessments and explain the most appropriate uses of each.

INTENDED PURPOSES

The major reason for using a norm-referenced tests (NRT) is to classify students. NRTs are designed to highlight achievement differences between and among students to produce a dependable rank order of students across a continuum of achievement from high achievers to low achievers (Stiggins, 1994). School systems might want to classify students in this way so that they can be properly placed in remedial or gifted programs. These types of tests are also used to help teachers select students for different ability level reading or mathematics instructional groups.

With norm-referenced tests, a representative group of students is given the test prior to its availability to the public. The scores of the students who take the test after publication are then compared to those of the norm group. Tests such as the California Achievement Test (CTB/McGraw-Hill), the Iowa Test of Basic Skills (Riverside), and the Metropolitan Achievement Test (Psychological Corporation) are normed using a national sample of students. Because norming a test is such an elaborate and expensive process, the norms are typically used by test publishers for 7 years. All students who take the test during that seven year period have their scores compared to the original norm group.

While norm-referenced tests ascertains the rank of students, criterion-referenced tests (CRTs) determine "...what test takers can do and what they know, not how they compare to others (Anastasi, 1988, p. 102). CRTs report how well students are doing relative to a pre-determined performance level on a specified set of educational goals or outcomes included in the school, district, or state curriculum.

Educators or policy makers may choose to use a CRT when they wish to see how well students have learned the knowledge and skills which they are expected to have mastered. This information may be used as one piece of information to determine how well the student is learning the desired curriculum and how well the school is teaching that curriculum.

Both NRTs and CRTs can be standardized. The U.S. Congress, Office of Technology Assessment (1992) defines a standardized test as one that uses uniform procedures for administration and scoring in order to assure that the results from different people are comparable. Any kind of test--from multiple choice to essays to oral examinations--can be standardized if uniform scoring and administration are used (p. 165). This means that the comparison of student scores is possible. Thus, it can be assumed that two students who receive the identical scores on the same standardized test demonstrate corresponding levels of performance. Most national, state and district tests are standardized so that every score can be interpreted in a uniform manner for all students and schools.

SELECTION OF TEST CONTENT

Test content is an important factor choosing between an NRT test and a CRT test. The content of an NRT test is selected according to how well it ranks students from high achievers to low. The content of a CRT test is determined by how well it matches the learning outcomes deemed most important. Although no test can measure everything of importance, the content selected for the CRT is selected on the basis of its significance in the curriculum while that of the NRT is chosen by how well it discriminates among students.

Any national, state or district test communicates to the public the skills that students should have acquired as well as the levels of student performance that are considered satisfactory. Therefore, education officials at any level should carefully consider content of the test which is selected or developed. Because of the importance placed upon high scores, the content of a standardized test can be very influential in the development of a school's curriculum and standards of excellence.

NRTs have come under attack recently because they traditionally have purportedly focused on low level, basic skills. This emphasis is in direct contrast to the recommendations made by the latest research on teaching and learning which calls for educators to stress the acquisition of conceptual understanding as well as the application of skills. The National Council of Teachers of Mathematics (NCTM) has been particularly vocal about this concern. In an NCTM publication (1991), Romberg (1989) cited that "a recent study of the six most commonly used commercial achievement tests found that at grade 8, on average, only 1 percent of the items were problem solving while 77 percent were computation or estimation" (p. 8).

In order to best prepare their students for the standardized achievement tests, teachers usually devote much time to teaching the information which is found on the standardized tests. This is particularly true if the standardized tests are also used to measure an educator's teaching ability. The result of this pressure placed upon teachers for their students to perform well on these tests has resulted in an emphasis on low level skills in the classroom (Corbett & Wilson, 1991). With curriculum specialists and educational policy makers alike calling for more attention to higher level skills, these tests may be driving classroom practice in the opposite direction of educational reform.

TEST INTERPRETATION

As mentioned earlier, a student's performance on an NRT is interpreted in relation to the performance of a large group of similar students who took the test when it was first normed. For example, if a student receives a percentile rank score on the total test of 34, this means that he or she performed as well or better than 34% of the students in the norm group. This type of information can be useful for deciding whether or not students need remedial assistance or is a candidate for a gifted program. However, the score gives little information about what the student actually knows or can do. The validity of the score in these decision processes depends on whether or not the content of the NRT matches the knowledge and skills expected of the students in that particular school system.

It is easier to ensure the match to expected skills with a CRT. CRTs give detailed information about how well a student has performed on each of the educational goals or outcomes included on that test. For instance, "... a CRT score might describe which arithmetic operations a student can perform or the level of reading difficulty he or she can comprehend" (U.S. Congress, OTA, 1992, p. 170). As long as the content of the test matches the content that is considered important to learn, the CRT gives the student, the teacher, and the parent more information about how much of the valued content has been learned than an NRT.

SUMMARY

Public demands for accountability, and consequently for high standardized tests scores, are not going to disappear. In 1994, thirty-one states administered NRTs, while thirty-three states administered CRTs. Among these states, twenty-two administered both. Only two states rely on NRTs exclusively, while one state relies exclusively on a CRT. Acknowledging the recommendations for educational reform and the popularity of standardized tests, some states are designing tests that "reflect, insofar as possible, what we believe to be appropriate educational practice" (NCTM, 1991, p.9). In addition to this, most states also administer other forms of assessment such as a writing sample, some form of open-ended performance assessment or a portfolio (CCSSO/NCREL, 1994).

Before a state can choose what type of standardized test to use, the state education officials will have to consider if that test meets three standards. These criteria are whether the assessment strategy(ies) of a particular test matches the state's educational goals, addresses the content the state wishes to assess, and allows the kinds of interpretations state education officials wish to make about student performance. Once they have determined these three things, the task of choosing between the NRT and CRT will become easier.
