**DMO 2.0:  
Exploring residents' national identification relationship to destination advocacy through  
social media**

**Short Abstract**

The present research seeks to understand the determinants of advocacy in a travel context, and explore advocacy behaviours using Facebook, a popular SNS platform for travel-based groups. Given national identification's focus on creating a sense of pride and belongingness to one's nation, it is proposed that the stronger one's identification, the more that person will advocate for their home nation. Further, the link between identification and advocacy is hypothesized to be positively influenced by an individual's destination image and tourism ethnocentrism. Findings demonstrate the importance of residents' perceptions of various national values such as pride, closeness, and love of their country on their desire to advocate for it to others. Similarly, a favourable image of their country can strengthen this relationship. This mixed-method research combines an online survey with the emergent methodology of netnography to build upon social identity and place image theories. Implications for destination marketers are discussed.
