**FISH PASSAGE 2015 – Groningen, The Netherlands, June 22-24**

# Bainbridge on scaling in fish swimming

Bainbridge 1958  
 $U/L = 0.25[L(3f - 4)]$   
 for 3 species

U=fish speed (cm/s)  
 L=total length (cm)  
 f=tail beat frequency (Hz)

Graphs for trout from  
 Bainbridge 1960

**NOTE:** attempt to scale fish speed with fish length: regression with  $1/L^{0.58}$  collapses data better than cm/s

Expressing speed in BL/s (i.e. U/L) is still used in most studies to collapse size-related data.

BL/s has dimensions of 1/s

Webb 2006:

Remarkably, most of the variation in tail-beat patterns with speed, for three species (dace *Leuciscus leuciscus*, goldfish *Carassius auratus*, and trout *Salmo irideus*=*Oncorhynchus mykiss*) could be expressed in a single equation. Bainbridge's results shored up scattered observations suggesting larger fish achieve higher absolute speeds, but lower relative speeds expressed in BL/s.

Knotty problems of how to improve representation of scaling into a single non-dimensional scaling function have largely been ducked since.

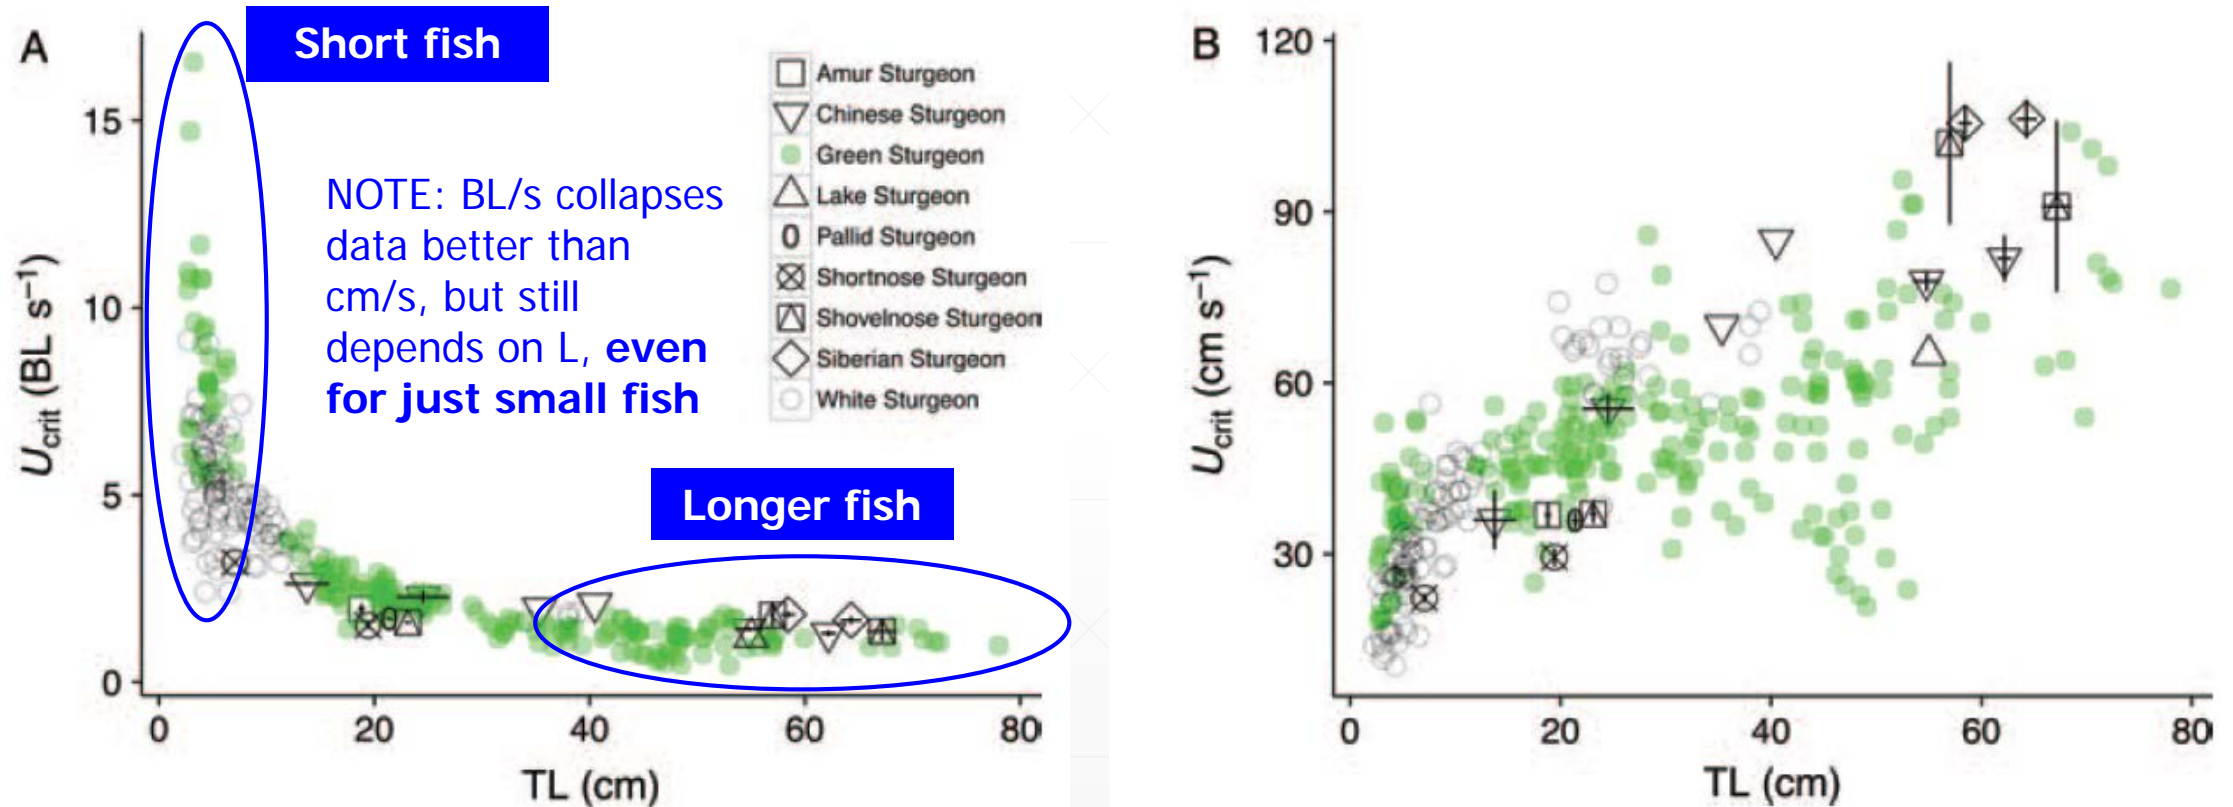

NOTE: Dimensionless parameters  $U_*$  and  $t_*$  collapse data better than  $BL/s$  (dimensions of  $1/s$ ).  $BL/s$  separates points by fish length;  $U_*$  and  $t_*$  bring together short and long fish.

$$U_* = \frac{U}{\sqrt{gl}}$$

$$t_* = \frac{t}{\sqrt{l/g}}$$

## Larval green and white sturgeon

Verhille, C.E., Poletto J.B., Cocherell, D.E., DeCourten, B., Baird, S., Cech, J.J. Jr., Fangue, N.A. 2014

**Brook trout**  
(*Salmo fontinalis*)  
Peake et al. 1997

Filled symbols reflect  
longer fish > 200 mm and  
open symbols < 200 mm.

- A:  $50 < l \text{ (mm)} \leq 100$
- B:  $100 < l \text{ (mm)} \leq 150$
- C:  $150 < l \text{ (mm)} \leq 200$
- D:  $200 < l \text{ (mm)} \leq 250$
- E:  $250 < l \text{ (mm)} \leq 350$
- F:  $350 < l \text{ (mm)} \leq 450$

### Longer fish:

- widest scatter & shift to the right when speeds in m/s
- wide scatter & shift to the left when in BL/s
- least scatter; longer & shorter fish come together with  $U_*$  and  $t_*$

1

2

3

Increasing velocity test with  
10, 5 & 2 min increments

**Brook & brown trout**  
Peake et al. 1997

Filled symbols are brown trout data and open symbols are brook trout, circles are fixed velocity test and squares are increasing velocity test.

widest scatter with m/s  
wide scatter with BL/s  
least scatter with  $U_*$  and  $t_*$

1  
2  
3

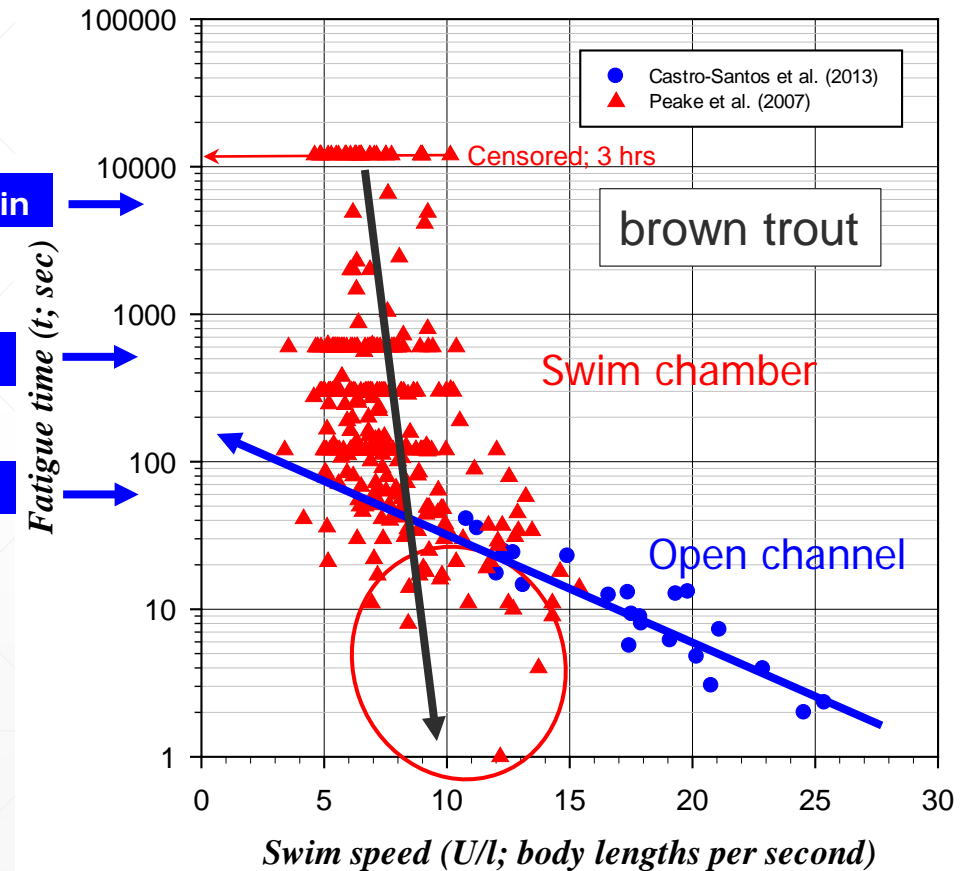

3 With  $U_*$  and  $t_*$  both brook & brown trout overlap showing performance similarity.

# Complete fatigue curves – data from seconds to tens of minutes needed

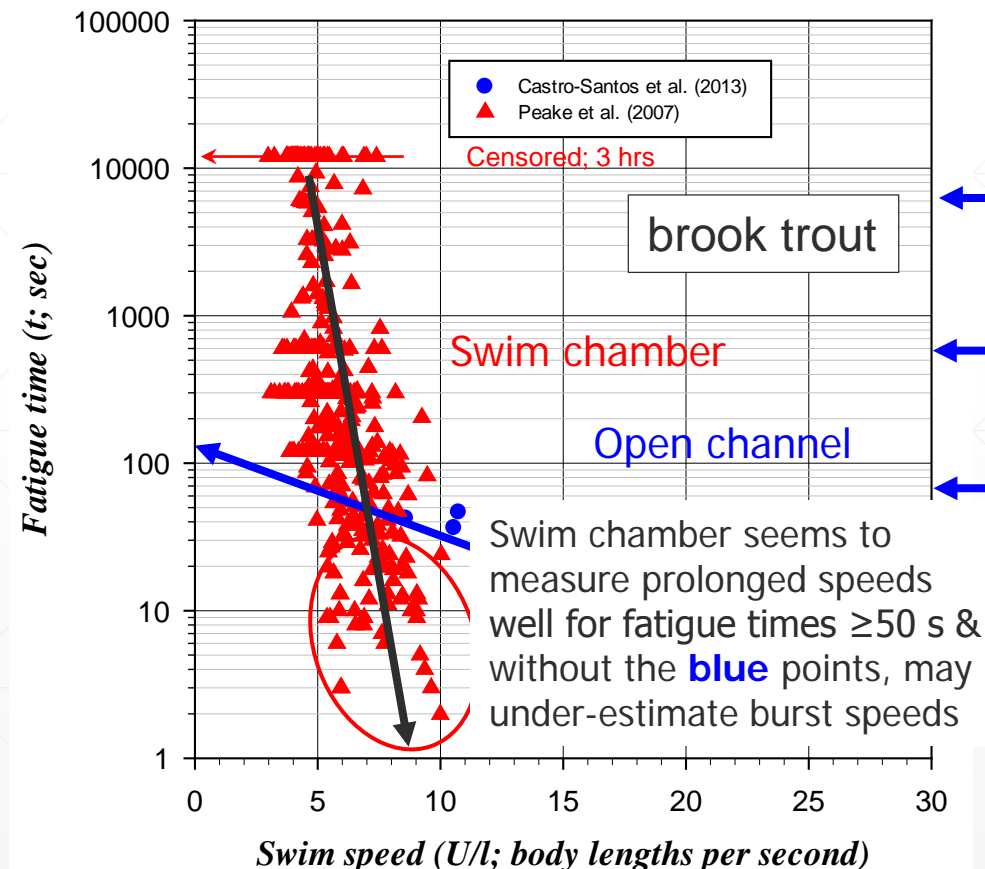

100 min  
10 min  
1 min

NOTE: predictions based only on open channel data (blue) would under-estimate prolonged speeds, while predictions based only on swim chamber data (red) would under-estimate burst speeds. Both are needed to define a complete fatigue curve.

# Complete fatigue curves – data from seconds to tens of minutes needed

## Salmon & Trout

Subcarangiform swimmers with burst & prolonged data

$$U = U/l \text{ or } BL/s$$

$$U_* = \frac{U}{\sqrt{gl}}$$

Species Groups	R <sup>2</sup>	SEE	R <sup>2</sup>	SEE	n
Steelhead trout	0.153	0.227	0.908	0.230	1,877
Steelhead and Rainbow trout ( <i>Oncorhynchus mykiss</i> )	0.298	0.276	0.911	0.236	3,084
Oncorhynchus species	0.330	0.284	0.856	0.290	6,077
Salmon and Trout (Salmoninae)	0.249	0.332	0.748	0.343	8,615

The dimensionless fish speed  $U_*$ , which includes  $\sqrt{l}$  as a scale, provides notably stronger regressions than traditional **BL/s** for both single species or groups of species of similar swimming performance, such as subcarangiform swimmer.

## Dimensionless vs BL/s – Salmon & Trout

NOTE: Data with independent variable as x or y are included. Least square (black lines) & Dening (colour lines) regressions provide similar results (presented at Ecohydraulics 2012, Vienna).

$R^2$  66.7% higher with  $U_*$

- ◇ Arctic char
- Atlantic salmon
- △ Brook trout
- Brown trout
- ▽ Bull trout
- Chinook salmon
- ⊖ Chum salmon
- Coho salmon
- Cutthroat trout
- ◆ Lake trout
- ◆ Pink salmon
- ◇ Rainbow trout
- Sockeye salmon
- △ Steelhead trout

## Summary table of data points

Dataset	Species	Reference	Length ( $l$ ; m)	$U$ (m/s)	Time ( $t$ ; s)	$U/l$ (BL/s)	Ustar	tstar	Appartus; Method
CS1	Brook trout	Castro-Santos et al. (2013)	0.114	3.16	2.45	27.69	2.985	22.7	Open channel; FV
CS2	Brook trout	Castro-Santos et al. (2013)	0.103	2.97	3.19	28.86	2.957	31.1	Open channel; FV
C&T1	Brown trout	Clough & Turnpenny (2000)	0.102	1.64	20	16.08	1.639	196.1	Stamina tunnel; IV
C&T2	Brown trout	Clough & Turnpenny (2000)	0.103	1.755	20	17.04	1.746	195.2	Stamina tunnel; IV
C&T3	Brown trout	Clough & Turnpenny (2000)	0.189	2.12	20	11.22	1.557	144.1	Stamina tunnel; IV
C&T4	Brown trout	Clough & Turnpenny (2000)	0.196	2.3	20	11.73	1.659	141.5	Stamina tunnel; IV
C1	Atlantic salmon	Colavecchia et al. (1997)	0.57	4.53	10.0	8.00	1.922	41.6	Open channel; FV
C2	Atlantic salmon	Colavecchia et al. (1997)	0.51	4.49	9.0	8.84	2.011	39.6	Open channel; FV
W1	Steelhead trout	Weaver (1963)	0.61	7.16	3.88	11.75	2.929	15.6	Open channel; FV
W2	Chinook salmon	Weaver (1963)	0.97	6.68	4.89	6.92	2.169	15.6	Open channel; FV
W3	Silver salmon	Weaver (1963)	0.61	5.33	3.28	8.75	2.181	13.2	Open channel; FV

## Salmon & Trout Group Processed Data

Fish separate based  
on length, since  
longer fish have  
higher speeds in m/s  
than shorter ones

NOTE: In m/s, the two  
small brook trout have  
much lower speed than  
the large steelhead,  
which is the fastest fish  
in this graph.

## Salmon & Trout Group Processed Data

Fish separate based on **length**, since **longer** fish have **lower** speeds in BL/s than shorter ones.

NOTE: In BL/s, the two small brook trout seem so fast as to be breaking some "speed barrier", while the large steelhead appears like a poor performer.

## Salmon & Trout Group Processed Data

Dimensionless parameters improve scaling with fish length since long and short fish come together.

NOTE: The two small brook trout are just above average performers and close to the large steelhead.

## Concluding remarks

- The commonly used dimensioned metric of BL/s is dependent on fish length and caution is needed in its use for predicting speeds for fish sizes larger or smaller than available data.
- The dimensionless speed  $U_*$  scales well with fish length and provides robust fatigue curve regressions for single or multiple species with similar swimming abilities.
- We are open to collaboration on meta-analyses of existing fish swimming performance data, including kinematics, and strategies on new research, taking advantage of the ecohydraulic approach which uses dimensionless parameters.

*Thank you!*

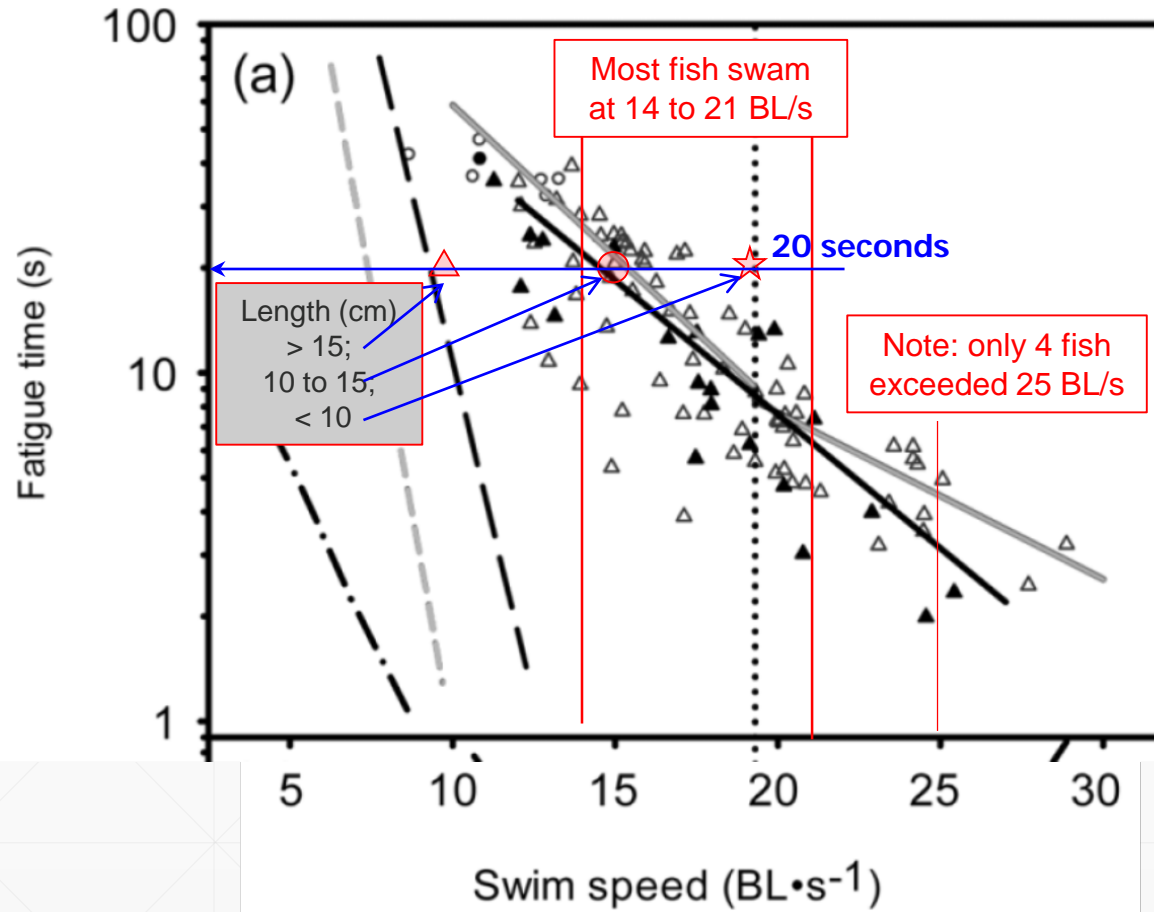

Fig. 5a. Swim speed – fatigue time relationship with data from Bainbridge (1960, sensu Brett 1964) for rainbow trout (dash-dot) and from Peake et al. (1997) for brook trout (short dashes) and brown trout (long dashes) for comparison.

**NOTE: Fatigue time scale is for data  $\leq 100$  s, yet Peak et al. (1997) have data up to 10,000 s, i.e. the most useful prolonged speed data are neglected in this comparison (see slides 7 & 8) .**

Brown Trout from Clough & Turnpenny 2000 (red symbols) increasing velocity swim tunnel test superimposed on Castro-Santos et al. 2003 data where the 20 second time step is used as endurance time and the critical swimming speed is swim speed. Data is relatively close fit, where the larger and smaller fish lengths from Clough & Turnpenny fall outside Castro-Santos et al. 2013 dataset and fish with a similar lengths have the best fit.

Data points in this figure were digitized and analysed to estimate the corresponding fish lengths for the highest swim speeds > 25 BL/s  
 Castro-Santos, Sanz-Ronda & J. Ruiz-Legazpi 2013.
